- Experimental probability is the result of an experiment, and the theoretical probability is based on the mathematical model developed on the probability theory.
- The accuracy of the results of the experiments directly depends on sample size of the experiment and accuracy is greater when the sample size is greater.

Difference Between Theoretical and Experimental Probability The theoretical probability is 8.3% and the experimental probability is 4%. Although the experimental probability is slightly lower, this is not a significant difference. In most experiments, the theoretical probability and experimental probability will not be equal; however, they should be relatively close.

Theoretical Probability Versus Experimental Probability What is the experimental probability that Manny will get a hit at his next time at bat? $P(\text{hit}) = \frac{2}{11}$. What is the experimental probability that Manny will not get a hit at his next time at bat? $P(\text{no hit}) = \frac{9}{11}$

Here your experimental probability is showing, look, out of 10,000 trials, experimental probability here is you had 10,000 trials, or 10,000 experiments I guess you could say.
